

4order

Automated Processing of Customer Purchase Orders

■ What is 4order?

Nearly 80% of customer purchase orders still enter companies on paper.

4order is an innovative software solution based on freeform technology and which automatically interprets any purchase order.

4order can be integrated into existing IT infrastructures (ERP systems, order entry software, etc).

4order is part of the integral solution of SEEBURGER:

The 100% partner integration which fully integrates all the business partners of a company. Customer purchase orders can thus be automatically processed irrespective of the medium (document-based, electronic files) and format (unstructured, EDifact, XML) and location.

■ What does 4order do?

The incoming paper purchase orders are interpreted by **4order** with freeform recognition.

The interpretation can be carried out in several languages and is compared to customer master data as well as article master data.

The result is the automatic order entry.

Unclear order processes are simply post-processed in **4order** or in the corresponding order entry system.

Post-processing workflows are available on the basis of SAP-Business Workflow or WebFlow.

Integration in the ERP system can occur in an extensive manner: e. g. full posting integration in SAP R/3 is realised via orderCONSOLE.

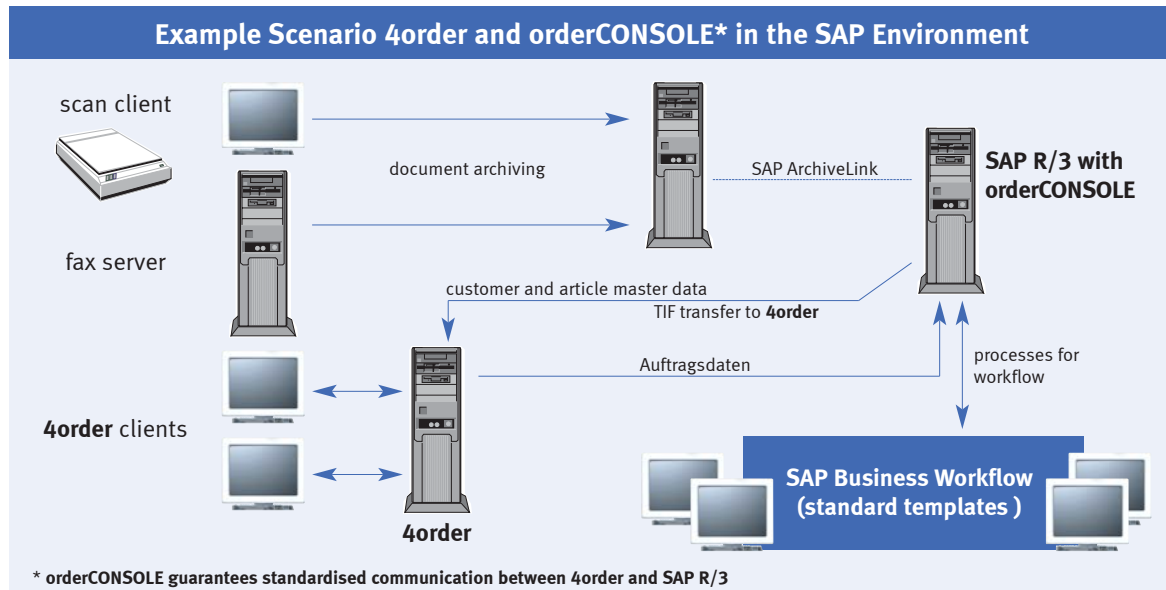

And of course, support of SAP NetWeaver, among others, is also guaranteed.

■ The Benefits

- Manual entry and validation checks are, to a large extent, automated.
- The historically developed processes are integrated.
- The throughputs times are drastically reduced:
And this reduces costs considerably.
- Format changes are rectified and processes automated.
- Higher return on investment.
- Project planning via an experienced implementation management team ensures a successful start. Our experienced consultants and IT experts are always at your disposal.

4order

Automated Processing of Customer Purchase Orders

■ Technical Detail Level

4order can be integrated in nearly all ERP systems: Oracle Application, Navision, Baan, etc. Furthermore, it is also possible to connect all common archiving systems and, via defined communication logics, any workflow system.

Our own standard workflows are also offered for order processing: Templates on the basis of SAP Business Workflow and WebFlow.

4order is of course also available as a component of the Business Integration Servers (BIS).

■ 4order Module

The integral solution of the **4order** software includes the batch orientated processing of incoming customer purchase orders. This is true for document-based and electronic incoming orders. For this, the **4order** has, among other things, the following modules:

- **4order** interpreter
- **4order** account assignment
- **orderCONSOLE** for SAP R/3
- SAP-Business Workflow templates
- orderWEBflow
- Foreign language modules and much more

■ Our Customers (excerpt)

Over 6,000 customers cannot be wrong, and this says a lot for the success of SEEBURGER solutions. In this context, **4order** really stands out due to its trend-setting orientation. The DUNLOP success story is convincing proof of this.

Our freeform technology is now profitably used by our customers with **4order** as well as in our outsourcing services area.

And in the future maybe by your company? We look forward to hearing from you.
